Response to February 12, 2004 Final Office Action Application No. 09/942,008 Page 2

IN THE CLAIMS

Claims 1-6. (Canceled)

- 7. (Currently Amended) A method for the preparation of a cathode active material composed of a compound having a general formula Li_xFePO₄ where 0 < x < 1.0, and a carbon material, with a carbon content per unit weight being not less than 3 wt% and with a powder density being not lower than 2.2 g/cm³ g/em3, comprising: mixing a plurality of starting materials for synthesis for a compound represented by the general formula Li_xFePO₄, milling and sintering the resulting mixture and adding a carbon material at any time point in the course of the mixing, milling and sintering, wherein said carbon material is such that, with an intensity area areal appearing in a number of waves of 1350 to 1360 cm⁻¹ em-1 and an intensity area areal appearing in the number of waves of 1570 to 1590 cm⁻¹ em-1 in the Raman spectrometry being D and G, respectively, an intensity area areal ratio A of D to G is ≥ 0.30, wherein lithium phosphate (Li₃PO₄) and iron phosphate hydrides (Fe₃(PO₄)₂.nH₂O, where n denotes the number of water molecules), are used as the starting material for the synthesis of Li_xFePO₄.
- 8. (Original) The method for the preparation of the cathode active material according to claim 7 wherein said carbon material is added before milling.
- 9. (Original) The method for a preparation of the cathode active material according to claim 7 wherein said carbon material is added after sintering and wherein said milling is carried out after addition of the carbon material.

Response to February 12, 2004 Final Office Action Application No. 09/942,008 Page 3

- 10. (Cancelled)
- 11. (Original) The method for the preparation of the cathode active material according to claim 7 wherein said sintering is carried out in a temperature range of 400 C to 900 C.
- 12. (Currently Amended) A method for a preparation of a non-aqueous electrolyte cell including a cathode containing a cathode active material composed of a compound having a general formula Li_xFePO_4 where 0 < x < 1.0, and a carbon material, with a carbon content per unit weight being not less than 3 wt% and with a powder density being not lower than 2.2 g/cm³ g/cm³, an anode containing an anode active material, and a non-aqueous electrolyte, said method including mixing a plurality of starting materials for synthesis for a compound represented by the general formula Li_xFePO_4 , milling and sintering the resulting mixture and adding a carbon material at any time point in the course of the mixing, milling and sintering, wherein said carbon material is such that, with an intensity area areal appearing in a number of waves of 1350 to 1360 cm⁻¹ cm⁻¹ and an intensity area areal appearing in the number of waves of 1570 to 1590 cm⁻¹ cm⁻¹ in the Raman spectrometry being D and G, respectively, an intensity area areal ratio A of D to G is ≥ 0.30 , wherein lithium phosphate (Li_3PO_4) and iron phosphate hydrides ($\text{Fe}_3(\text{PO}_4)_2$, nH_2O , where n denotes the number of water molecules), are used as the starting material for the synthesis of Li_xFePO_4 .
- 13. (Original) The method for the preparation of a non-aqueous electrolyte cell according to claim 12 wherein said carbon material is added before milling.

Response to February 12, 2004 Final Office Action Application No. 09/942,008 Page 4

- 14. (Original) The method for the preparation of the non-aqueous electrolyte cell according to claim 12 wherein said carbon material is added after sintering and wherein said milling is carried out after addition of the carbon material.
 - 15. (Canceled)
- 16. (Original) The method for the preparation of the non-aqueous electrolyte cell according to claim 12 wherein said sintering is carried out in a temperature range of 400 C to 900 C.
- 17. (Original) The method for the preparation of the non-aqueous electrolyte cell according to claim 12 wherein said non-aqueous electrolyte is a solution-based non-aqueous electrolyte.
- 18. (Original) The method for the preparation of the non-aqueous electrolyte cell according to claim 12 wherein said non-aqueous electrolyte is a polymer-based non-aqueous electrolyte.
